Proposition d'atelier:

Title:
Migratory corridors and African migrations in comparative perspective (Mediterranean and Latin America).

Abstract:
This panel aims to bring together specialist researchers from different geographies to discuss, debate and comparatively analyze the current trends and transformations of extra-continental African migratory flows and their mobilities in migratory corridors in the Mediterranean and Latin America, which have experienced increasing flows from this continent in the last 30 years. This effort also aims to open a space for the analysis of the forms of articulation and relationship between these two corridors, which are increasingly interrelated as articulated nodes in complex global trajectories of African migrants.

This panel aims to develop a space for discussion to compare methodological strategies for the study of the reception and mobilities of these migrations, to discuss the contemporary transformations that feed current trends, to reflect on recent changes in the trans-African and transcontinental migration corridors that articulate these geographical spaces, and to analyze the global policies and trends of migration management in these corridors of African migrant populations.

This panel aims to bring together researchers studying these dynamics in Latin America and the Mediterranean whose work mainly addresses temporary reception dynamics, mobilities and global/international migration systems with a focus on African migration.
